

System

Techno Ø4 strong

The **Techno STRONG** security system is implemented from mesh panels with Ø4mm wire and posts with a section of 50x50; matching is done through iron printed plates and linking-through screws.

The system is mainly used to define the hazardous areas, having to guarantee high impact resistance combined with a high flexibility.

Cheap

The cost is limited because it is made with self-supporting fence.

Modular

The Techno system has been created with the aim to be interchangeable with the other systems: hybrid structures can be created in some areas where the framed system stands to the adjacent one made of Techno system.

The doors are actually made with the Novatek series Ø3mm wire.

Visibility

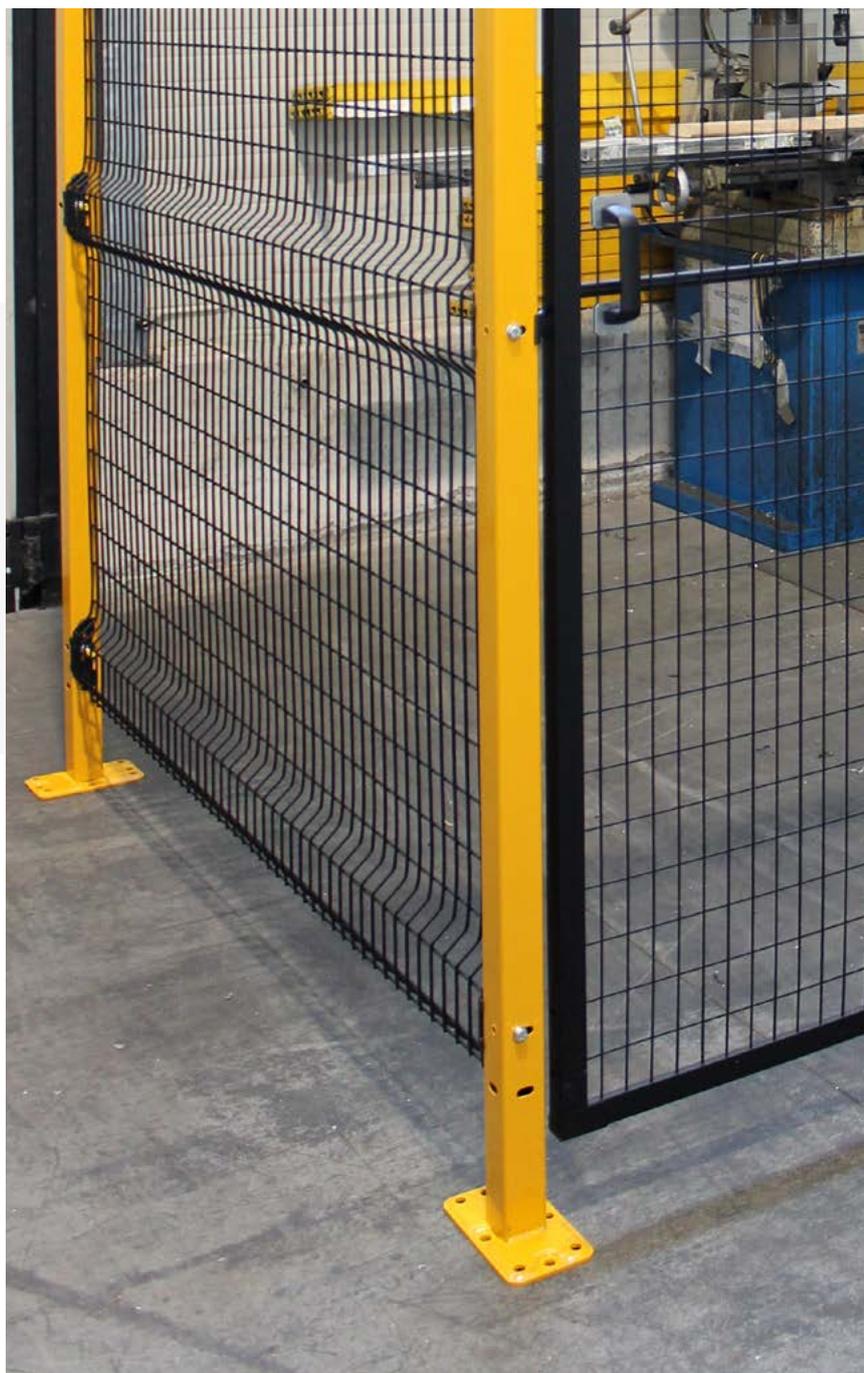

The innovative system of the 32x67 network improves the vision of the machinery inside the protected area.

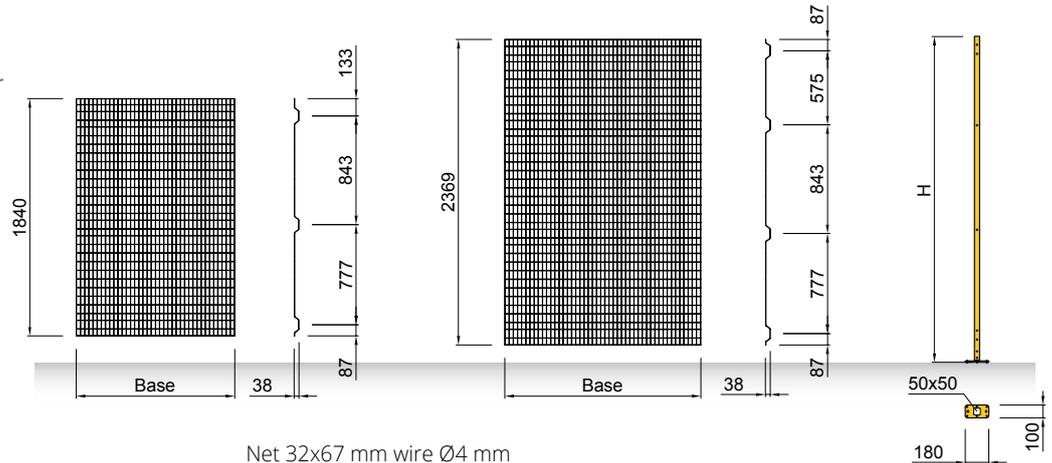

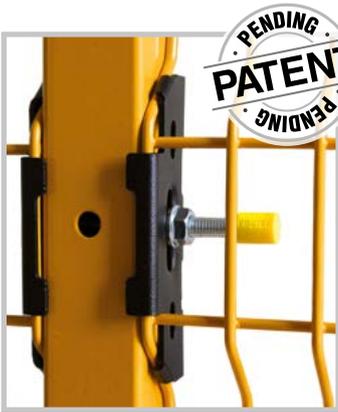

Changes in place

This system has the great advantage of being modified in-place by use of very few tools and, a lot important, it does not have to be repainted.

Solid

The Techno STRONG system has a resistance impact comparable to that of the panel with frame.

The patented unmissable screws kit is easy to install and always comes provided.

Net 32x67 mm wire Ø4 mm
Ground light 160mm for paneling - 100mm for doors
