

System Shockproof Posts for Infrared Rays

This post, designed to protect the BRI from impact, has an 80x100 section, 2.5mm thick and is available in the H = 1300 and H = 2000 versions.

It is equipped with slots for height adjustment for the BRI, while the ground plate is equipped with a central hole which, once anchored to the ground, facilitates the alignment between emitter and receiver.

The upright can be combined with the leveling kit which allows a further adjustment.

Cost

The cost is modest as it is made of painted steel RAL1003. Moreover, the possible adjustments allow saving time on the assembly.

Adjustment

The upright can be comfortably adjusted without additional drilling.
